(passcode: SPLS2025)

While public gardens are generally appreciated as visitor attractions, they are well suited to conduct science and develop accessible solutions to pressing 21st century societal needs. University gardens in particular, exist at the intersection of research, education and outreach - offering opportunities to support institutional mission directly while also building bridges that connect science with practice, support plant conservation initiatives, and contribute to student success through experiential- and service-learning. This talk will present examples from the University of Arizona Campus Arboretum that demonstrate how integrative approaches in mission delivery benefit student success and contribute to environmental and human health.
